

Special Attention is Called to the Following:

A. The division of the river system into two districts with the Wasatch Dam as the division point, throws the bulk of water and the intense use in the lower division, and the smaller number of diversions, The extensive farming, and the longer distances of travel in the upper division. To equalize the condition and to render better service to the whole river, the upper district should include all the river above Deer Creek, and an adequate method of transportation be arranged.

B. Before the beginning of another season all diversions should be equipped with proper intake gates insuring all diversion more constant stream and better delivery.

C. The "Wentz" report 1914 recommends an automatic register on the weir carrying the storage water into the Provo District; this should by all means be installed to record beyond doubt the amount of storage water delivered into the Provo District.

D. During the past season storage water was delivered at the Wasatch Dam and to the Washington canal intake at Woodland without figuring any loss in transmission. Before an equal and proper distribution of the river can be made, inflow, seepage return, and the effect of the presence of the storage water should be determined.

E. In order to insure to the diversions near the lower end of the Wasatch division against sustaining the losses that occur by reason of a falling river, or by the diversions higher up the stream taking amounts

greater than their portions. The plan outlined in
your letter of July 18th must be followed.
